

## List of Tables

1.1	Road length by categories and by type of surface in India.....	1
2.1	Effect of various SCMs on cement paste, mortar and concrete.....	69
4.1	Percentage passing of coarse and fine aggregates for PQC.....	106
4.2	Mechanical properties of coarse and fine aggregates.....	106
4.3	Properties of OPC, RSA and MS.....	109
4.4	Chemical composition of OPC, RSA and MS.....	110
4.5	Thermal analysis of RSA.....	113
4.6	Characteristics of superplasticizer.....	114
5.1	Mix proportions of cementitious materials.....	118
5.2	Normal consistency, setting time and expansion of cement paste and HRWR dosage for cement mortar.....	119
5.3	Compressive strength of cement mortar admixed with RSA and MS.....	130
5.4	Percentage change in compressive strength of cement mortar admixed with RSA and MS w.r.t. control mortar R0.....	131
5.5	Hardened density of cement mortar admixed with RSA and MS.....	137
6.1	Quantity of materials (kg) per m <sup>3</sup> of concrete.....	143
6.2	Percentage passing of coarse and fine aggregates for PQC.....	143
6.3	Compressive strength of concrete.....	144
6.4	Percentage change in compressive strength of admixed concrete w.r.t. control concrete (R0).....	144
6.5	Flexural strength of concrete.....	148
6.6	Percentage change in flexural strength of admixed concrete w.r.t. control concrete (R0).....	149
6.7	Split tensile strength of concrete.....	151
6.8	Percentage change in split tensile strength of admixed concrete w.r.t. control concrete (R0).....	152

6.9	Prediction models for compressive strength ( $f_c$ ) w.r.t. curing age ( $x$ )	179
6.10	Prediction models for flexural strength ( $f_r$ ) w.r.t. curing age ( $x$ ).....	179
6.11	Prediction models for split tensile strength ( $f_t$ ) w.r.t. curing age ( $x$ )...	179
6.12	Empirical relationships between compressive and flexural strength.....	181
6.13	Comparison of different compressive-flexural strength equations.....	182
6.14	Empirical relationships between compressive and split tensile strength...	184
6.15	Comparison of different compressive-split tensile strength equation.....	185
7.1	Air content in fresh concrete.....	193
7.2	Saturated water absorption (%).....	195
7.3	Percentage reduction of SWA in admixed concrete w.r.t. R0.....	195
7.4	Initial rate of water absorption ( $\times 10^{-6} \text{m/s}^{0.5}$ ).....	196
7.5	Secondary rate of water absorption ( $\times 10^{-6} \text{m/s}^{0.5}$ ).....	196
7.6	Percentage reduction of initial RoWA in admixed concrete w.r.t. R0.....	198
7.7	Percentage reduction of secondary RoWA in admixed concrete w.r.t. R0	198
7.8	Coefficient of water absorption ( $\times 10^{-10} \text{m}^2/\text{s}$ ).....	200
7.9	Percentage reduction of CoWA in admixed concrete w.r.t. R0.....	201
7.10	Chloride ions (%) at 10-20 mm depth.....	202
7.11	Chloride ions (%) at 25-35 mm depth.....	202
7.12	Percentage reduction of chloride ions in admixed concrete w.r.t. R0 (at 10-20 mm depth).....	204
7.13	Percentage reduction of chloride ions in admixed concrete w.r.t. R0 (at 25-35 mm depth).....	204
7.14	Loss of mass (%) under 30 days immersion in acidic solution.....	207
7.15	Percentage reduction in loss of mass in admixed concrete w.r.t. R0.....	208
7.16	Compressive strength (MPa) of concrete mixes.....	210

7.17	Loss of compressive strength (%).....	211
7.18	Various strength of concrete at 28 days of water curing and 28 days of combined curing (14 days water + 14 days ACC).....	231
7.19	Percentage increase in strength of concrete due to 28 days of combined curing w.r.t. 28 days of water curing.....	231
7.20	Mathematical relation between saturated water absorption ('y') and curing age ('x').....	237
7.21	Mathematical relation between the initial rate of water absorption ('y <sub>i</sub> ') and curing age ('x').....	238
7.22	Mathematical relation between the secondary rate of water absorption ('y <sub>s</sub> ') and curing age ('x').....	238
7.23	Mathematical relation between the secondary ('y <sub>s</sub> ') and the initial rate of water absorption ('y <sub>i</sub> ').....	239
7.24	Mathematical relation between the coefficient of water absorption ('y <sub>c</sub> ') and days of curing ('x').....	239
7.25	Mathematical relation between chloride percentage at 10-20 mm depth ('y <sub>10</sub> ') & days of curing ('x').....	240
7.26	Mathematical relation between chloride percentage at 25-35 mm depth ('y <sub>25</sub> ') & days of curing ('x').....	240
7.27	Mathematical relation between chloride percentage at 25-35 mm depth ('y <sub>25</sub> ') & at 10-20 mm depth ('y <sub>10</sub> ').....	241
7.28	Mathematical models for percentage mass loss ('l <sub>m</sub> ').....	247
7.29	Mathematical models for percentage loss of compressive strength ('l <sub>c</sub> ')..	247
7.30	Mathematical models between percentage loss of compressive strength ('l <sub>c</sub> ') and percentage mass loss ('l <sub>m</sub> ').....	248
7.31	Mathematical models between compressive strength under water curing and acidic immersion ('f <sub>ca</sub> ') and compressive strength under water curing ('f <sub>c</sub> ').....	248
7.32	Mathematical models for strength after 14 days water + 14 days ACC...	249
8.1	Category-wise design axle load repetitions for fatigue analysis.....	255
8.2	Pavement structural details for different concrete mix.....	255

8.3	Percentage of Axle Load Class (assumed).....	256
8.4(a)	BUC fatigue damage analysis (for day-time (6 hour)) of concrete mix R0 at $h = 0.26$ m.....	257
8.4(b)	TDC fatigue damage analysis (for night-time (6 hour)) of concrete mix R0 at $h = 0.26$ m.....	257
8.5(a)	BUC fatigue damage analysis (for day-time (6 hour)) of concrete mix R10 at $h = 0.23$ m.....	258
8.5(b)	TDC fatigue damage analysis (for night-time (6 hour)) of concrete mix R10 at $h = 0.23$ m.....	258
8.6(a)	BUC fatigue damage analysis (for day-time (6 hour)) of concrete mix M7.5 at $h = 0.2$ m.....	259
8.6(b)	TDC fatigue damage analysis (for night-time (6 hour)) of concrete mix M7.5 at $h = 0.2$ m.....	259
8.7(a)	BUC fatigue damage analysis (for day-time (6 hour)) of concrete mix R5M7.5 at $h = 0.21$ m.....	260
8.7(b)	TDC fatigue damage analysis (for night-time (6 hour)) of concrete mix R5M7.5 at $h = 0.21$ m.....	260
8.8(a)	BUC fatigue damage analysis (for day-time (6 hour)) of concrete mix R10M7.5 at $h = 0.23$ m.....	261
8.8(b)	TDC fatigue damage analysis (for night-time (6 hour)) of concrete mix R10M7.5 at $h = 0.23$ m.....	262
8.9	CFD values for different ' $k_e$ ' and different trial thicknesses.....	263
8.10	Cost comparison of 1 m <sup>3</sup> of concrete and 1 km of NH.....	267
