

Table of contents

List of figures	xxv
List of tables	xxix
1 Introduction	1
1.1 Background	1
1.2 Traffic-Induced Vibrations (TIV): Mechanisms, Impacts and System-Level Perspectives	6
1.3 Critical Gaps and Limitations of Existing Approaches	9
1.4 Need for an Integrated Multidisciplinary Framework	11
1.5 Research Objectives and Scope of the Doctoral Research	14
1.6 Significance and Novel Contributions	16
1.7 Structure of the Thesis	19
2 Literature Review	21
2.1 Preface	21
2.2 Foundations of Traffic-Induced Vibrations (TIV)	22
2.2.1 Historical Evolution of Traffic-Induced Vibration Studies	22
2.2.2 Frequency Content and Dynamic Loading Characteristics	26
2.2.3 Soil-Structure Interaction and Wave Transmission Behavior	28
2.2.4 Modeling Frameworks for Traffic-Induced Vibrations	29

2.3	Vehicle Classification Studies	32
2.3.1	Intrusive Techniques	33
2.3.2	Non-Intrusive Techniques	35
2.4	Forecasting and Optimization in GPS-Augmented Mixed Traffic Scenarios	40
2.4.1	Limitations of Traditional GPS-Based Traffic Forecasting	40
2.4.2	Machine Learning-Based Traffic Forecasting Models	41
2.4.3	Augmentation of GPS Data with Auxiliary Inputs	43
2.4.4	Toward Hybrid and Context-Aware Models	44
2.4.5	Spatio-Temporal Deep Learning Models in Forecasting	45
2.5	Speed-Hump–Induced Vibrations	46
2.5.1	Experimental Investigations	46
2.5.2	Soil-Structure Interaction and Wave Propagation	46
2.5.3	Numerical and Analytical Modeling	47
2.5.4	Material-Based Mitigation Approaches	47
2.5.5	Advanced Signal Analysis and Multidirectional Monitoring	48
2.6	Research Gaps	48
2.7	Conclusion	50
3	Methodology	53
3.1	Preface	53
3.2	Signal Preprocessing Framework	53
3.2.1	Raw Signal Acquisition and Frequency Inspection via FFT	54
3.2.2	Band-Pass Filtering and Noise Removal	55
3.2.3	Windowing to Remove Transients of the Signal	56
3.2.4	Energy-Based Segmentation for Uniformity of the Signals	57
3.3	Variational Mode Decomposition for Signal Analysis	58
3.3.1	Rationale for Using VMD	59

3.3.2	Extraction of IMFs and Dominant Mode Identification	59
3.3.3	Feature Extraction from VMD Modes	60
3.4	Vibration Equivalence Metric Formulation	61
3.4.1	Reference Vibration Emission Levels (RVEL)	61
3.4.2	Passenger Car Vibration Equivalence (PCVE)	62
3.5	Vibration-Based Vehicle Classification Model	63
3.5.1	Energy-Based Feature Extraction from Vibration Signals	63
3.5.2	Class Imbalance Analysis and Mitigation	64
3.5.3	Ensemble Learning via Stacked Classifier	65
3.5.4	Loss Function, Regularization and Optimization	66
3.5.5	Model Evaluation and Statistical Validation	66
3.6	Traffic Forecasting and Route Optimization Framework	67
3.7	Conclusion	71
4	Study Design and Data Collection	73
4.1	Preface	73
4.2	Instrumentation Framework	74
4.2.1	Accelerometer	74
4.2.2	Mounting Mechanism for Accelerometer	74
4.2.3	Vehicle Speed Measurement via LIDAR	75
4.2.4	Visual Confirmation via Indoor Wi-Fi Camera	75
4.2.5	On-Site Deployment Layout	76
4.3	Study Locations	78
4.3.1	Vehicle Classification and Vibration Equivalence Studies	78
4.3.2	Route Optimization Study	78
4.3.3	Speed Hump Vibration Study	79
4.4	Signal Preprocessing Pipeline	81

4.4.1	Raw Signal Characteristics and Challenges	82
4.4.2	Spectral Insights Using FFT	82
4.4.3	Band-Pass Filtering: Justification and Application	83
4.4.4	Windowing and Removal of Transients	88
4.4.5	Signal Segmentation Using Maximum Energy Windowing	90
4.5	Speed Hump Vibration Analysis	93
4.5.1	Introduction	93
4.5.2	Motivation and Objectives of This Study	94
4.5.3	Site Selection and Study Overview	95
4.5.4	Data Collection Overview	95
4.5.5	Descriptive Dataset Summary	96
4.5.6	Signal Preprocessing and Feature Extraction	98
4.6	Reference Vibration Emission Level (RVEL) and Passenger Car Vibration Equivalence (PCVE)	99
4.6.1	Introduction	99
4.6.2	Motivation and Objectives	100
4.6.3	Data Pre-Processing	103
4.6.4	Feature Extraction from the Maximum Energy Segment	103
4.7	Vehicle Classification Study	113
4.7.1	Introduction	113
4.7.2	Motivation and Objectives	115
4.7.3	Site Survey and Data Collection and Raw Signal Pre-Processing	115
4.7.4	Feature extraction from the maximum energy window	116
4.7.5	Class imbalance analysis and mitigation	118
4.7.6	Stacked classifier-based training	121
4.7.7	Statistical Analysis of Model Performance	128

4.7.8	System Parameters	129
4.7.9	Vibration Signals to Vehicle Classification Algorithm	130
4.8	Route Optimization and Traffic Forecasting Using an Augmented Machine Learning Framework	132
4.8.1	Introduction	132
4.8.2	Motivation and Objectives	133
4.8.3	Site Survey and Data Collection	134
4.8.4	Data collection	134
4.8.5	Data extraction and pre-processing	135
4.8.6	Machine learning-based forecasting of traffic volume	136
4.8.7	Augmentation with GPS Data	143
4.8.8	Model training and building classifier	144
4.9	Conclusions	146
5	Empirical Characterization and VMD-Based Analysis of Speed Hump-Induced Vibrations	147
5.1	Preface	147
5.2	Results	148
5.2.1	Unified Signal Vehicle Response Across Speed Breaker Types	151
5.2.2	Variational Mode Decomposition (VMD) for Multi-Modal Vehicle Vibration Analysis	153
5.3	Discussion	166
5.3.1	Impact of Vehicle Type and Breaker Profiles on Vibration Metrics	166
5.3.2	Directional Vibration Characteristics	167
5.3.3	VMD-Based Signal Decomposition	168
5.4	Conclusion	177

6	Standardization of Vibration Metrics Using PCVE and RVEL	179
6.1	Preface	179
6.2	Results	180
6.2.1	Reference Vibration Emission Level	180
6.2.2	Passenger Car Vibration Equivalence (PCVE)	198
6.2.3	Software Implementation	202
6.3	Discussion	203
6.3.1	Significance of the RVEL–PCVE Paradigm	204
6.3.2	Detailed Insights from RVEL Analyses	204
6.3.3	Certain Weak Correlations in X/Y vs. Stronger Z Trends	209
6.3.4	PCVE Findings: Relative Comparisons and Practical Utility	211
6.3.5	Engineering and Policy Ramifications	212
6.3.6	Overall Explanations for Negative Slopes and Directional Discrepancies	213
6.4	Conclusion	215
7	Vibration-Based Vehicle Classification Using Machine Learning Techniques	219
7.1	Preface	219
7.2	Results	220
7.2.1	Performance matrices	220
7.2.2	Statistical Significance Analysis of Set 85th Test Accuracy	227
7.2.3	Test accuracy and model run time	229
7.3	Discussion	230
7.3.1	Performance matrices	231
7.3.2	Impact of Feature Selection	233
7.3.3	Repeated Experimentation and Statistical Significance	236
7.3.4	Model run time analysis and performance evaluation	236

7.4	Conclusions	239
8	Traffic Forecasting and Route Optimization Using Classified Vehicle Data and GPS Augmentation	243
8.1	Preface	243
8.2	Experimental evaluation and results	244
8.2.1	Dataset	244
8.2.2	Implementation details	245
8.2.3	Experimental results	246
8.2.4	Real-world evaluation	257
8.3	Field implications from this work	258
8.4	Conclusion	260
9	Conclusion	263
9.1	Preface	263
9.2	Summary of Findings	263
9.3	Conclusions Mapped to Research Objectives	265
9.4	Practical Implications	267
9.4.1	Study-wise Practical Implications	267
9.4.2	Unified Framework Applications and Integration Potential	269
9.5	Theoretical Implications	272
9.6	Contribution of the Study	274
9.7	Limitations and Future Scope	275
	References	279
